Most models are rather cheap. A few are pricier. Does organization and license influence these trends?

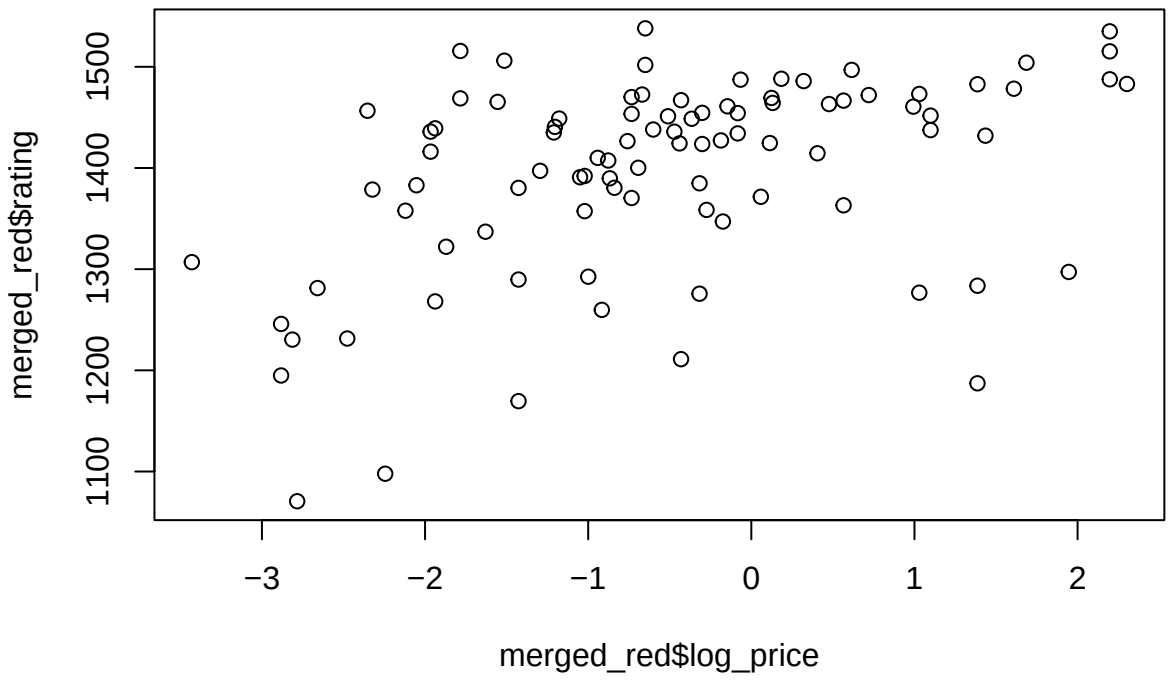

```

```

```
plot(log(merged$pricing.completion), merged$rating)

There appears to be a positive correlation between pricing and rating. Completion price appears more correlated with rating than prompt price, which makes sense. Completion price represents the price of the actual response of the LLM.

Let's see if it holds up in simple regression.

```
model_completion <- lm(log(pricing.completion) ~ rating, data= merged)

While our model predicts price at only a weak-to-moderate level, using linreg to predict rating gives quite successful results.

From here, it is best to try and incorporate our categoricals. Let's do some exploration of them, first:

```r
ggplot(merged_red, aes(x = reorder(organization, log_price, FUN = mean),
                       y = log_price, fill = organization)) +
  geom_boxplot() +
  theme_minimal() +
  labs(title = "Value Distribution Across Groups", x = "Firm",
       y = "mixed price (USD per 1M tokens)") +
  theme(
    axis.text.x = element_text(angle = 90, vjust = 0.5, hjust = 1),
    legend.position = "none")
```

```
ggplot(merged_red, aes(x = reorder(organization, rating, FUN = mean),
                       y = rating, fill = organization)) +
  geom_boxplot() +
  theme_minimal() +
  labs(title = "Value Distribution Across Groups", x = "Firm",
       y = "rating") +
  theme(
    axis.text.x = element_text(angle = 90, vjust = 0.5, hjust = 1),
    legend.position = "none")
```
